DNA sequences for typical ribosomal gene spacers from *Xenopus laevis* and *Xenopus borealis** NOTICE: THIS MATERIAL MAY BE PROTECTED
BY COPYRIGHT LAW (TITLE 17 U.S. CODE)

Paul Labhart and Ronald H. Reeder

Hutchinson Cancer Research Center, 1124 Columbia Street, Seattle, WA 98104, USA
Submitted March 16, 1987

Accession no. Y00132

We have determined a few short DNA sequences that had not been previously reported from the *X. laevis* ribosomal gene spacer and about 3 kb of previously unreported sequence from the *X. borealis* spacer. For the convenience of other workers, we have compiled our data with other published reports so that, for the first time, one can refer to a typical, complete sequence for each of these spacers.

For both spacers, the sequence is shown from the C in the HindIII-recognition site at the 3' end of the 28S rRNA (nucleotide 1) to the transcription start site of the 40S precursor (*X. laevis*: at nucleotide 3952; *X. borealis*: 3930). The sequence is compiled from the following sources: *X. laevis*: 1 to 197: (1,2); 190 to 532: (3); 529 to 1474: (2); 1475 to 1664: present work; 1665 to 2910: (2); 2804 to 3051: (1); 3052 to 3634: inferred from restriction data in (4); 3635 to 4000: (1,2). *X. borealis*: 1 to 453: (3); 454 to 3490: present work; 1081 to 1422: inferred from chemical cleavage pattern and restriction analysis; 2000 to 2296: inferred from restriction data; 3385 to 4000: (5). The clones used were pXlr14 in (1,3) and in the present work, pXl108 in (2,4), and pXbr101A in (5) and in the present work.

FIGURE 2: A typical intergenic spacer region from the ribosomal DNA of *Xenopus borealis*.

Partial sequences of spacers from other clones can be found in references (6-10). The sequence of the *X. laevis* 40S coding region, up to the 3' end of the 28S sequence, can be assembled from references (7,11,12, and 13).
